

# Problem: Online Food Delivery System

## Problem

A popular food delivery startup wants to automate its ordering process. Currently, restaurant staff manually calculate order amounts and maintain customer information, leading to billing errors and delayed deliveries.

The company has decided to build a software solution where customers can place food orders and the system automatically calculates the final bill.

Each customer can order multiple food items. Every food item has an item ID, item name, price, and quantity.

The system should calculate the total amount for each ordered item and generate the final bill for the customer.

Customers should also be able to view their order summary before confirming the order.

The company management wants the software to be developed using Object-Oriented Programming principles so that future enhancements such as discounts, coupons, and delivery tracking can be easily added.

The application should use separate classes for food items and customers.

## Requirements

### Class: FoodItem

#### Data Members

- itemId
- itemName
- price
- quantity

#### Methods

- Constructor
- calculateAmount()
- displayItemDetails()

### Class: Customer

#### Data Members

- customerId
- customerName
- mobileNumber

#### Methods

- Constructor
- displayCustomerDetails()

## Operations to Perform

1. Create at least 4 FoodItem objects.
2. Create 2 Customer objects.
3. Display all item details.
4. Calculate amount for each item.
5. Calculate total bill.
6. Display customer details.
7. Print complete order summary.

## Sample Output

Customer Name : Rahul Sharma

Item Name : Burger  
Price : 120  
Quantity : 2  
Amount : 240

Item Name : Pizza  
Price : 300  
Quantity : 1  
Amount : 300

-----  
Total Bill: 540  
-----

# Evaluation Criteria (100 Marks)

| Component              | Marks |
|------------------------|-------|
| Class Design           | 15    |
| Object Creation        | 15    |
| Constructors           | 15    |
| Data Members           | 10    |
| Methods Implementation | 20    |
| Output Formatting      | 10    |
| Code Quality & Naming  | 10    |
| Viva Explanation       | 5     |
